Summary

Data Science and Computing Science minor student at Simon Fraser University with a unique interdisciplinary foundation spanning human behavioral psychology, database systems, and data analysis. Proven ability to bridge the gap between non-technical workflows and technical execution by translating complex requirements into optimized data architectures. Resourceful problem solver with a strong bias for action, experienced in managing end-to-end technical projects, writing clean system documentation, and manipulating large-scale datasets using Python and SQL.

TECHNICAL SKILLS

Languages: Python (Pandas, NumPy, Scikit-learn), SQL, R, C++

AI & Automation Tools: Prompt Design & LLM Exploration, Google Analytics (Certified), Git

Databases & Tools: Relational Schema Mapping, ER Diagrams, SQL Server, Tableau, Microsoft Azure

Education

Simon Fraser University

Bachelor of Science in Cognitive Science (Interdisciplinary program including Psychology and Computing Science)
Minor: Computing Science
2021 Fall - Current

PROJECTS & COMPETITIONS

CMPT 354: Full-Stack Database Application (Restaurant Delivery Platform) *Project Lead & Database Architect* | Spring 2026

- Led a cross-functional student development team to design, build, and deploy a web application, ensuring seamless collaboration and on-time delivery.
- Translated core business and user workflow requirements into optimized ER diagrams and robust relational schema mappings.
- Formulated complex SQL scripts and advanced table joins to maintain data integrity across multiple tables while connecting the front-end interface to a live production server.
- Created clear, structured system documentation enabling team members to understand, maintain, and iterate on the database layout without friction.

Kaggle: Home Credit Default Risk Prediction *Data Analyst* | Spring 2026

- Evaluated complex relational data across multiple tables to predict loan repayment capabilities and discover statistical trends relating to financial default risks.
- Programmed Python data preparation scripts utilizing Pandas to handle structural data transformations, including grouping and calculating statistical aggregations (mean, max, sum) on overdue timelines.
- Constructed and trained a LightGBM classification model utilizing specialized hyperparameters to score financial predictive data, securing a final evaluation metric score of 0.72333.

Kaggle: Porto Seguro's Safe Driver Prediction *Data Analyst* | Spring 2026

- Addressed a highly imbalanced dataset where the minority class was less than 3.7% by implementing a hybrid Undersampling and SMOTE strategy.
- Combined feature engineering with an optimized XGBoost classifier to handle skewed data structures.
- Achieved a private Gini Coefficient of 0.26679, representing a 15%+ improvement over the baseline model
